Our Project

We made a Python based chat room where multiple clients can chat back and forth once connected to the server.

Components and How It Works

We used python to create a socket and connect to a server.

Then we established connection through the server IP.

Here is a quick demonstration!!!

Most Difficult Part

The most difficult part of this project was getting the server to output each person's chat to the other without having to send a chat to them first.

What We Learned

We learned how use sockets and IP addresses to connect multiple devices together.

The geeks website showed us how to send the messages to each other through the server.
